QSI SOFTWARE LICENSE AGREEMENT ............................................................................. 44
BASIC ANALOG OPERATION

Atlas O recommends that you get used to operating and having fun with your new Gold Series sound-equipped steam locomotive before exploring its more advanced features and programming options. Read through this section and be up and running with your new Atlas O Quantum-equipped locomotive in fewer than five minutes.

Running the Locomotive

Use a DC power pack with a standard direction switch. Set the direction switch to run your locomotive forward.

- Turn the throttle up slowly until you hear the Quantum System™ come on. You will hear Start Up sounds and the steam Dynamo revving up as the headlight turns on.
- Continue to turn up the throttle voltage until the locomotive starts to move in Forward. The Directional Lighting will turn on. The locomotive will start out slowly due to special Quantum Inertial Control™ that resists rapid increases or decreases in speed.
- To stop the locomotive, bring the throttle down (but not so low that the sounds quit) and wait until locomotive slows to a standstill on its own.

Reversing the Locomotive

This simple operation is done in exactly the same way as standard DC locomotives are reversed.

- Bring the locomotive to a stop, and turn the power all the way off.
- Flip the direction switch and reapply power to go in the opposite direction. Directional Lighting will change.

Whistle

Blow the authentic Steam Locomotive Whistle for short or long blasts; you control the duration.

- While the locomotive is moving, flip the direction switch to turn on the Whistle.
- To shut off the Whistle, flip the direction switch back.
- The locomotive will not change direction when you blow the Whistle.

Note: If you use a reversing-throttle that changes continuously from forward-to-off-to-reverse or if you flip the direction switch too slowly from one position to the other, you can momentarily lose track power as the switch is being moved through its center position.

Bell

You can turn on the Bell and leave it on while you operate other functions on the locomotive.

- Turn the Bell on with a Quick flip-and-back operation of the direction switch.
- Turn the Bell off with a second Quick flip-and-back operation of the direction switch.

Note: The Bell will stay on until you do another Quick flip-and-back operation of the direction switch to turn it off or until you interrupt the track power.

Note: If you do a Slow flip-and-back operation, you will get a short Whistle hoot instead of the Bell. If you try to do a very short Whistle blast using a Quick operation, you will activate the Bell instead.

Note: If you have trouble doing the Quick flip-and-back operation, try holding the power pack in place with your other hand to keep the unit from slipping.
ADVANCED ANALOG FEATURES

Starting the Locomotive
Unlike standard model locomotives that start moving at very low track voltages, Atlas O Quantum-equipped locomotives require a minimum of about five volts to operate the electronics. Also, the response to the throttle is realistically much slower, just like a prototype locomotive.

- Turn the throttle up slowly until you hear the Quantum System™ come on with a Long Air Let-off sound.
- Continue to turn up the throttle voltage until the locomotive just starts to move in Forward. This voltage is called V-Start\(^1\). Steam exhaust (Chuffing) and optional Cylinder Cocks will sound in sync with the motion of the drive wheels. Labored steam exhaust sounds are produced in proportion to the locomotive’s acceleration and Load setting.

Locomotive Inertia Effects
Your new Atlas O Gold Series steam locomotive is pre-programmed at the factory to use Regulated Throttle Control (RTC) in Analog operation. A model locomotive under RTC operates as though it has the mass and inertia of a prototype locomotive. As a result, your locomotive will resist starting up too quickly if at rest and will resist changes in speed once moving. It takes a little practice to learn to move the throttle and wait until the locomotive responds. If you prefer that your locomotive respond almost immediately to the throttle, reprogram it to use Standard Throttle Control (STC), which has no Inertial Control (See Example 1 under Analog Programming, on page 15).

- As you slow the locomotive down by reducing the throttle to a little below V-start, the Steam Chuff labored sound volume decreases, while Squealing Brake sounds occur as the Steam locomotive comes to a slow stop\(^3\).
- If you leave your Steam locomotive in Neutral for at least 25 seconds and then slowly turn up the throttle, the locomotive plays Cylinder Cocks sounds as it starts moving. The Cylinder Cocks sounds automatically terminate after 16 repetitions or when the locomotive reaches a speed greater than 12 smph.

ADVANCED WHISTLE OPERATION

Doppler Effect
This sound effect changes the pitch and volume of the Whistle, Bell, and other steam sounds as the locomotive passes by.

- While the locomotive is moving toward the observer, flip the direction switch to turn on the Whistle.
- Wait at least one second while the Whistle is blowing.
- Just before the locomotive passes in front of the observer, flip the direction switch back and forth quickly so the Whistle does not shut off. You will hear the Doppler Effect as the locomotive passes by.
- Either flip the direction switch back to shut off the Whistle, or continue with long or short Whistle operations. When you are finished blowing the Whistle, the locomotive sounds will automatically return to normal after a few seconds. If the Bell was on, it will shut off just before the sounds return to normal.

Note: The faster the locomotive is moving, the greater the Doppler shift. Below 15 smph (24 skph), there is no Doppler shift.

Playing the Whistle

- Prototype engineers would often “play” their whistles by controlling the flow of compressed air. In particular, engineers often had a signature sound associated with how they ended their Whistle sequences. Some Quantum System sound sets have special Whistle Endings that can be activated using the direction switch to produce a unique sound effect similar to that of a prototype engineer’s “playing” the whistle.
- Flip the direction switch to blow the Whistle for at least one second.

The normal way to end the Whistle is to flip the direction switch back. To do the special Whistle Ending, add an immediate Quick flip-and-back operation.

Note: If you wait too long to do the Quick Flip-and-Back operation, the Bell might turn on instead.

---

1 Not all features described below may be included in your locomotive model.
2 It is useful to mark where V-Start is on your throttle. V-Start can also be reprogrammed to different values for different power packs.
3 Squealing Brakes occur if the locomotive speed exceeds 40 scale-miles per hour (64 scale kilometers/hour) and then slows down to below 20 smph (32 skph).
Automatic Features

Quantum features\(^4\) are automatically controlled as a function of the directional state of the locomotive as described in the table below.

<table>

<td>Arms after 25 seconds.</td>
</tr>
</tbody>
</table>

Note: If your locomotive has a Mars Light, the Headlight will be off instead of “Dim” in all states except Forward where it will be Bright.

Neutral

In Neutral, the locomotive will continue to make prototypical sounds appropriate to its resting state.

- Enter Neutral by turning the throttle down below V-Start but not off, and wait for the locomotive to stop\(^6\). The Headlight will dim, and the optional Mars Light will switch to steady-on. The Rear Tender Light will turn off or dim when entering Neutral.
- You will hear a Short Air Let-off when the locomotive stops moving and enters Neutral, a Long Air Let-off about three seconds later, followed by Air Pumps and other background sounds, which come on after 5 to 10 seconds. After the Air Pumps start, you can use the direction switch to blow the Whistle or turn on or off the Bell.

Changing the Locomotive’s Direction without Turning off the Sound

- To change the locomotive’s direction while the locomotive is in Neutral, you can use the power pack’s direction switch.
- Put the locomotive in Neutral by bringing the throttle down below V-Start and waiting for the locomotive to stop.
- Flip the direction switch after you hear the Short Air Let-off, but before you hear the Long Air Let-off followed by Air Pump sounds turning on. During this short time (3 seconds), the Whistle will not blow when you flip the direction switch.
- Turn up the throttle anytime thereafter to operate the locomotive in the opposite direction.

If you have waited until the Air Pumps start in Neutral and now wish to change direction, you can either:

- Reduce the throttle to off; change the direction switch; and turn the throttle back up to repower the locomotive.
- Alternatively, leave the locomotive in Neutral; flip the direction switch (the Whistle will come on); and then turn up the throttle.

Note: When the locomotive starts to move in the opposite direction, the Whistle will stop automatically and then hoot one more time if the direction is Forward for a total of two hoots. If the direction is Reverse, the Whistle will hoot two more times for a total of three hoots\(^7\). To prevent the first Whistle hoot from being too long, do not delay in turning up the throttle after you have flipped the direction switch.

Train Load

You can set your Steam locomotive to have any of 16 different Load levels, which represent added inertia from rolling stock. (See Analog Programming, Option 2, on page 13.) The higher the Load setting, the greater the inertia effect during acceleration and deceleration. Level 0 is the default, which is no Load.

\(^4\) Not all features, or the ability to dim the lights, may be available in your particular locomotive model.

\(^5\) Cylinder Cocks arming after Start Up and/or after 25 seconds in Neutral can be set using CV 51.2. The settings in this CV apply to both Analog and DCC operation.

\(^6\) If Regulated Throttle Control is enabled, it is important to wait until the locomotive stops on its own. The loco’s electronic Inertial Control will keep it moving even though you have reduced the throttle far enough below V-Start to stop the locomotive. When stopping the locomotive, do not reduce the throttle so far that all the sounds turn off.

\(^7\) Standard US prototype railroad signaling is two hoots before starting in forward and three hoots before starting in reverse. Other countries have different signaling. Check your Steam Locomotive Information Sheet for the Whistle sequences used on your model.
Sound-of-Power™

During acceleration, the steam locomotive will produce labored Chuffing (based on Load setting) until the locomotive has achieved its final speed where it will then produce the standard sounds appropriate to its throttle setting. If starting up after an extended period in Neutral, you will first hear the sounds of Cylinder Cocks venting steam and water from the steam chest. Under deceleration, the Chuffing sounds are less labored until the locomotive achieves its final speed where it will again produce the standard sounds appropriate to its throttle setting.

 Helpers

Prototype Helpers are locomotives that are used to provide extra power and/or braking for a heavily loaded train. The Quantum System provides an easy method for programming how each locomotive should behave by allowing you to select between a Normal locomotive, a Lead locomotive, a Mid Helper, an End Helper, or a Pusher. Each type of Helper locomotive has different lights and sounds enabled or disabled. These lights and sounds are explained under the description of Option 3 in the table on page 13 of the Analog Programming section.

Normal and Reversed Direction

The Quantum System also allows you to reverse the directional sense of your locomotives. This is normally not an issue with DC two-rail trains since all locomotives will go in the same direction whether they are facing forwards or backwards. However, certain features like Directional Lighting do depend on the directional sense. When making up a train with different Helper types, it is recommended that you also change the directional sense of any Helper that is intended to be operated backwards within the consist. See “Option 4 Direction”, in the Analog Programming section on page 13.

Additional Analog Operation Features Available with the Quantum Engineer™ Controller

Your new Atlas O Gold Series Steam locomotive is equipped with QSI’s QARC™ (Quantum Analog Remote Control) Technology. QARC Technology uses special remote control signals to operate various Quantum System features without the need for complicated and expensive digital systems. With QARC technology, you can operate most features that are otherwise available only in Digital Command Control (DCC), plus certain new features that are not yet available in DCC. QARC will allow you to: 1) turn on or off individual lights, 2) shut down and start up locomotives, 3) make up consists easily, 4) simplify Analog programming, 5) set System Volume or Mute while train is operating, 6) trigger Coupler Crash sounds, 7) operate prototype-like Air Brakes, 8) turn on Dynamic Brakes, 9) activate Status or Speed Reports, 10) arm steam Cylinder Cocks, and operate many other features. The QARC System makes Analog operation simpler than DCC by eliminating the need to configure function keys. Every button on the QARC controller does exactly what it is labeled to do. The only major difference between QARC and DCC is that, with QARC, you are not able to operate independently multiple trains that are on the same powered track section so that they are running at different speeds at the same time.

The current QARC controller is called the Quantum Engineer™ (Atlas Item #325) and may be used for operating multiple QARC-equipped HO locomotives or for operating A MAXIMUM OF ONE QARC-EQUIPPED ATLAS O LOCOMOTIVE. The Quantum Engineer™ can be added to your existing Analog DC power pack in fewer than five minutes. Wiring is simple: two red wires go to the variable DC output from the power pack and two black wires go to the track, as shown in Figure 1. Place the Quantum Engineer beside your power pack or mount it directly on most popular power packs, as shown in Figure 2. All features on the power pack remain the same including throttle and reverse switch control. For further information, see the DC Analog Reference Manual for QSI Quantum (HO) Equipped Locomotives, Ver 4.0, which is available on the QSI web site at http://www.qsindustries.com/.
Programming and Sound Control with the Quantum Engineer

Figure 3 shows the Star Pad key section of the Quantum Engineer, which controls both sound and programming. During normal operation, the Volume ▲ and Volume ▼ keys control the system volume, and the Mute key toggles the sound between normal and a low volume level. In addition, the STC and RTC keys allow you to easily select between Standard Throttle Control and Regulated Throttle Control. You can enter the analog Programming Mode by pressing and holding the Prgm key at the same time as you turn on the track power and increase the voltage to 7 to 8 volts. The Red power light on the Quantum Engineer will blink, and your locomotive directional lights will blink to indicate that you have entered programming. Press the Next key to advance from one Programming Option to the next. The locomotive will speak out which Option you have selected. The Prev key allows you to move backwards through the Program Options. Once you have selected an Option, use the Volume ▲ or Volume ▼ keys to program that option.

For example, if you wish to change the Whistle volume or other sounds independently, enter programming with the Prgm key, and press and hold the Next key until you hear the locomotive count up to thirteen (13) and respond with the verbal message “Whistle Volume”. Press the Volume ▲ key to increase the Whistle volume, or press the Volume ▼ to decrease the Whistle volume. As you press the volume up or down keys, you will hear the Whistle hoot at each new volume setting. You can now move to other options by pressing the Next or Prev key. For instance, if you pressed the Next Key, you would advance to the next option, “14” where the locomotive would announce “Bell Volume”. You can now use the Volume ▲ or Volume ▼ to change the Bell volume and hear the Bell sound at each new volume setting. To leave programming, simply shut off the track power. See the table on page 13 for additional listings of Programming Options

8 See the DC Analog Reference Manual for QSI Quantum (HO) Equipped Locomotives, Ver 4.0, for a complete list of analog programming options. This Reference Manual applies to both HO scale (Q1a) and O scale (Q2) hardware configurations that use Quantum System Version 7 software. This manual may be downloaded from the QSI web site (http://www.qsindustries.com/)

<td></td>
</tr>
</tbody>
</table>

Note: In the above table, “X” is the current value of the Program Option. Defaults are shown in parenthesis along with the option name; defaults for volume levels are listed on the Steam Locomotive Information Sheet that is included with your locomotive.

9 Programming is even simpler using a Quantum Engineer Controller. (See pages 8-9.)
10 POP is short for “Program Option”.
11 You can set volume with the Manual Volume Control or with Programming or both.
12 Lights that are not controlled by the Quantum System decoder will remain on.
Entering Programming Using the Direction Switch

Use this simple sequence to enter Programming using the direction switch.

- Apply power and turn up the throttle to hear the sound system come on.
- Within five seconds of powering up, turn on the Bell with a Quick flip-and-back operation.
- Within three seconds of the Bell turning on, turn off the bell with a second Quick flip-and-back operation.
- Within three seconds, turn the Bell back on again with a third Quick flip-and-back operation.

If you delay too long after power has been first applied, the opportunity to enter Programming will time out, and you will need to start again by shutting off and reapplying track power.

Once you perform these three bell operations after applying power, the Bell will shut off automatically. You will hear “Enter Programming,” and the Headlight and Reverse Light will flash alternately off and on.

Scrolling through the Program Options

- After entering Programming, you will hear an announcement of the first Program Option, “Option 1 - System Volume”.
- To access other Program Options, simply flip the direction switch to the opposite position and leave it there. Listen as each option number is announced in order.
- When you hear the Option Number that you want, flip the direction switch back and leave it there. After you stop at an option you will hear the option number and name announced. When you are scrolling through and stopping at Program Options, you are not making any changes. To make changes you must actually enter the Program Option.

Note: If you accidentally go to a higher option number other than the one you wanted, simply turn the power off, re-enter Programming and start again13. Once you reach the last Program Option, it will continue to announce the last option number.

13 If you have a Quantum Engineer, you can move both back and forth through Program Options.

Entering a Program Option and Making Changes

After the verbal announcement of a Program Option, you can enter that option by performing a Slow or Quick flip-and-back operation of the direction switch14. Upon entering a Program Option, you will hear the current setting for that option. For unused Program Options, you will hear “Reserved”. For any volume option, you will hear “Volume equals X” (where “X” is its current volume level setting). After a moment, you will hear the sound playing at its current volume15.

Note: It is easy to distinguish between doing a Quick and Slow operation. When you flip the direction switch to do a Slow operation, wait until you hear a low level “hiss” sound from the locomotive and then immediately flip the direction switch back. To do a Quick operation, make sure you flip the direction switch back before you hear the “hiss” sound.

Note: Entering a Program Option does not change the settings for that option; it only provides information about its current value. After entering the Program Option, additional Slow or Quick flip-and-back operations will program new settings as described in the table on page 13. For all level adjustments, a Quick operation will decrease one level, while a Slow operation will increase one level.

Note: Since “System Volume” is the first Program Option, you can use Quick or Slow operations immediately after entering Programming to change the System Volume.

Moving on to Other Program Options or Leaving Programming

- Flip the direction switch at anytime to the opposite position, and leave it there. The Quantum System will first return to and announce the current Program Option and then automatically advance on to higher options.
- Exit Programming anytime you want by turning the power off and then back on again.

Example 1: Setting Throttle Mode (Program Option # 10)

The throttle mode setting will determine whether your locomotive uses Regulated Throttle Control (RTC) or Standard Throttle Control (STC).

- Enter Programming after powering up your locomotive by turning the Bell on, then off, and then on again, as described above.
- After the “Enter Programming” followed by “Option One - System Volume” announcement of the first Program Option, flip the direction switch and leave it there. You will hear the announcement “Option 1, 2, 3 … etc.” Stop when you hear “one-zero” by quickly moving the direction switch back. You will hear “Throttle Mode”.

14 If you have a Quantum Engineer, Quick and Slow operations are done with specific program buttons.
15 Setting any volume in Analog will also apply to DCC and vice-versa.
Use a Slow or Quick operation of the direction switch to enter this option. If the throttle mode is at its default value (RTC), you will hear “Mode equals Regulated;” otherwise, you will hear “Mode equals Standard.”

Use a Slow or Quick operation of the direction switch to change the Throttle Mode. Repeated Slow or Quick operations will cause the throttle mode to alternate between its two possible values “Regulated” or “Standard”.

Once you have selected the Throttle Mode you wish to use, turn the throttle off. When you power up again, your locomotive will be using the Throttle Mode that you have just selected.

Example 2: Setting V-Start (Program Option # 8)

- This option will determine the voltage (and throttle position) at which the locomotive will leave Neutral and start moving.
- Enter Programming after powering up your locomotive by turning the Bell on, then off and then on, as described above.
- After the “Enter Programming” announcement followed by “Option One - System Volume” announcement for the first Program Option, flip the direction switch and leave it there. You will hear the announcement “Option 1, 2, 3 . . . etc.” Stop when you hear the number “8” by quickly moving the direction switch back. You will hear “V-Start”.
- Use a Slow or Quick operation of the direction switch to enter this option. You will hear “V-Start equals X” where “X” is the track voltage value currently set for leaving Neutral.
- Use a Slow or Quick operation of the direction switch to activate this option. Hear the message “Set throttle to V-Start.” After three seconds, the voltage will be announced. If you move the throttle, the new track voltage value is announced a few seconds later.
- Once the power pack throttle is set to your desired value, use a Slow or Quick operation of the direction switch to start the V-Start voltage setting procedure. The locomotive may or may not move. If it moves, it will move at a very slow speed. The Bell will ring continually for about 25 seconds, indicating the correct value is being calculated. If you chose a very low voltage setting, be patient. If the locomotive, during this procedure, does not appear to be responding as described here, return to the beginning of this option or start over completely, but choose a slightly higher throttle setting.
- At the end of the process, the Whistle will hoot, signifying the end of the operation, and you will hear the message “V-Start = X” where “X” is the new setting.

Example 3: Setting V-Max (Program Option # 9)

V-Max is set in the same manner as V-Start except after entering this Program Option, you will hear “Set throttle to V-Max” which is the throttle position where you want the full track voltage to be applied to the motor (usually about 80% of full throttle). Then do a Quick or Slow operation to start the V-Max setting procedure. Like V-Start, the bell will ring continually until the voltage is set followed by a Whistle hoot to indicate the procedure is finished. Setting V-Max is much quicker than V-Start.

Note: During the V-Max setting process, the locomotive will not move as it may do under the V-Start setting process.

For more information on DC Operation, download from the QSIndustries web site http://www.qsindustries.com the DC Analog Reference Manual for QSI Quantum (HO) Equipped Locomotives, Ver. 4.0. This manual applies to both HO scale (Q1a) and O scale (Q2) locomotives that use Quantum System Version 7 software.

V-Max should not be set too low when using RTC. For most MRC™ power packs, the best choice for V-Max is about 1.5 volts below the highest throttle setting as determined by the Quantum System built-in Voltmeter.

---

16 See section above: Moving on to Other Program Options or Leave Programming.
DCC OPERATION

These steps will allow you to start operating your Atlas O Gold Series Quantum-equipped steam locomotive immediately using any DCC system that is compatible with the applicable NMRA DCC specifications.

- Select locomotive number 3.
- Set your DCC system to use either 128 speed steps (preferable) or 28 speed steps (acceptable).
- Start your locomotive immediately by double-pressing the F6 DCC function key\(^ {18} \) to hear the locomotive Start Up sounds. The Directional Lighting System (Headlight, Rear Tender Light and optional Mars Light\(^ {19} \)) will be on.
- Increase the throttle to leave Neutral. Steam Exhaust (Chuffing) and optional Cylinder Cocks will sound in sync with the motion of the drive wheels. Labored Steam Exhaust sounds are produced in proportion to the locomotive’s acceleration and Load settings.
- When you reduce the throttle to zero, you will hear a Short Air Let-off when the locomotive stops moving, indicating that it has entered Neutral. A Long Air Let-off will occur about one second later, followed by Air Pumps and other background sounds\(^ {20} \).
- The direction of your locomotive will change when you press the direction key on your DCC throttle.

Locomotive Inertia Effects

Locomotive Inertia Effects

Your new Atlas O Gold Series steam locomotive is pre-programmed at the factory to use Regulated Throttle Control (RTC) in DCC operation. A model locomotive under RTC operates as though it has the mass and inertia of a prototype locomotive. As a result, your locomotive will resist starting up too quickly if at rest and will resist changes in speed once moving. It takes a little practice to learn to move the throttle and wait until the locomotive responds. If you prefer that your locomotive respond almost immediately to the throttle, reprogram it to use Standard Throttle Control (STC), which has no Inertial Control (Use CV 56.4. See page 32).

18 It does not need to be F6; any function or speed command will activate the locomotive. It is only when a locomotive is in Shut Down that an F6 command is necessary.
19 The lighting features available depend on the locomotive model.
20 Neutral sounds also include steam Pop-off, Water Injector, and Blow Down, all of which turn on and off randomly.

Function Keys

The following table lists the features that have been pre-assigned to your DCC function keys. Operation of these keys can be different in the Neutral state (locomotive stopped) and the Motive states (locomotive moving in Forward or Reverse). After you have selected your locomotive, simply press any of the function keys listed below to produce the effects described.

<table>

Function Key Remapping

The Quantum System supports the NMRA 0-12 function key standard; the old 0-8 standard is not supported. If you have a DCC command station that supports only the older 0 to 8 function key standard, you will have no way to initiate Shut Down in Neutral with these pre-assigned feature number to function key mappings. There is an interim solution to this problem; swap the features assigned to the F7 and F9 outputs in Neutral by doing the following:

- Set CV49 to 9; set CV50 to 1; and set CV53 to 145. Now F7 in Neutral controls Shut Down
- Set CV49 to 11; set CV50 to 1; and set CV53 to 9. Now F9 in Neutral controls Long Air Let-off
Automatic Features

Automatic Quantum Features depend on the directional state of the locomotive. Automatic Control can be enabled or disabled by the indicated function key. The state of each Automatic feature in each direction is shown in the table below.

<table>
<thead>

</tr>
</tbody>
</table>

When an indicated function key enables an “automatic” feature, it operates according to the states shown in the above table. For instance, enabling the Automatic Mars Light in Neutral will not cause the Mars Light to strobe since their automatic behavior would have them at a steady-on setting in that directional state; however, if you then entered Forward, the Mars Light would begin to strobe. When an indicated function key disables an “automatic” feature, that feature is off. For instance, disabling the “Automatic Mars Light” will immediately shut off the Mars Light in any direction and they will not turn on again until the automatic feature is enabled.

**Note:** Use CV 55 to change the behavior of lights from what is shown in the above table and description.

**Note:** Lights and other features can be assigned to function keys and configured to different kinds of operation and initial conditions in CV 53 (Output Feature Assignment) and CV 55 (QSI Feature Configuration). See the NMRA DCC Reference Manual for QSI Quantum Q1a and Q2 Equipped Locomotives, Version 4.2.0.

**Note:** Cylinder Cocks can also be armed in Neutral with either the F7 key or the F6 Start Up key without having to wait for the 25 second time out period.

Coupler and Coupler Crash Sounds (F3)

There are two ways to use the F3 key.

- As your locomotive is about to couple up to a string of cars, press the F3 key to trigger the crashing sound of locomotive coupling. Use the F3 key again as the locomotive moves out to trigger the same sound as the slack is taken up in the cars.
- Use the F3 key in Neutral to produce uncoupling sounds as you disconnect cars over uncoupler magnets. Press the F3 key once to produce the sound of the lift bar and coupling pin being raised. This first press also arms the uncoupling sound effect. Press the F3 key again while moving or in Neutral to trigger the sound of the coupler knuckle opening and air-lines parting.

Sound-of-Power™

If CV 3 or CV 23 and CV 4 or CV 24 have been set to non-zero positive values, your steam locomotive will produce additional labored Chuffing sounds under acceleration and lighter Chuffing sounds under deceleration. The level of labored sounds is proportional to the values for these four CV’s, and to how much the throttle is increased or decreased.

**Note:** When starting out after an extended period in Neutral (over 25 seconds), the Cylinder Cocks will vent 16 times or until speed exceeds 12 smph.

Whistle and Bell Buttons (F2, F1)

Some DCC controllers have separate whistle and bell buttons along with function keys assigned to whistle and bell operation. The bell is usually assigned to F1 and the whistle is usually assigned to F2. The F2 key behaves differently from the whistle button.

- Pressing the F2 key and releasing it will cause the whistle command to come on and stay on, until you press F2 again.
- Pressing the whistle button will send the whistle command only as long as you hold the button down.
Pressing the F1 key and releasing it will cause the Bell to come on and stay on, until you press F1 again. There is no difference in operation between the bell button and its corresponding function key.

**Doppler Effect Operation (F6)**

With DCC, you can trigger the Doppler Effect by quickly interrupting the whistle signal in the same way as described under Analog Operation, or you can use the function key (F6) which is assigned to the Doppler Effect in Neutral.

- Start the Whistle and/or Bell by pressing and releasing its (their) function keys.
- Press F6 to hear the Doppler shift. The steam locomotive sounds return to normal a few seconds after the whistle button is turned off with the F2 key.
  
  **Note:** If you do not turn on either Whistle or Bell, the Doppler shift will still occur but will be less dramatic.

  **Note:** If the Bell was on, it will shut off prior to sounds returning to normal.

**Squealing Brake and Flange Sounds (F7)**

Quantum provides automatic Squealing Brakes as a locomotive slows to a stop. The operator can also control squealing sounds for continuous and variable brake sounds for protracted stops or to simulate the sounds of squealing wheel flanges on curved track.

- To enable Automatic Squealing Brakes, operate the locomotive over 40 smph (64 skph). Squealing brakes sounds will then sound automatically when the speed is reduced to less than 20 smph (32 skph).
- Pressing the F7 key when the locomotive is moving at any speed will manually activate Squealing Brake sounds, and repeated pressings while the Squealing Brake sounds are occurring will continue the sounds uninterrupted.

  **Note:** If you slow the locomotive too quickly, the brake sounds will terminate abruptly when the locomotive stops and enters Neutral.

  **Note:** If you lower your throttle to speed step 0 on a moving locomotive, the F7 key will apply Air Brakes to slow the locomotive. See next section.

**Air Brakes (F7)**

If you are in RTC mode or have selected any non-zero deceleration inertia or momentum value in CV 4 and/or CV 24, the F7 key can be used to apply Air Brakes to stop the locomotive more quickly than it would normally stop from the inertia settings. To use Air Brakes:

- Turn the throttle down to speed step 0 on a moving locomotive; this enables the F7 key to act as a brake.
- Press the F7 key. Hear a brief brake squeal sound and air being released from the brake lines continually. The longer the period of time that the air is released, the greater the braking action.
- Press the F7 key again to stop the air release. The train will continue to slow at the last braking value.

  **Note:** F7 will apply brakes when set to 1 (On) and will stop the air release when set to 0 (Off). Depending on the initial setting for F7, when you turn your throttle down to speed step zero, you may need to press the F7 key twice to first apply brakes.

- If you want to apply more braking, press the F7 key again to release more air. When you reach the desired amount of braking, press F7 again to stop the air release.
- Turn up the throttle to any value above 0 to release the brakes; this action resets the locomotive’s deceleration to a value determined by the sum of CV 4 and CV 24.
- If the locomotive is in Neutral when the F7 key is pressed, the Cylinder Cocks will arm.

  **Note:** If the DCC throttle is set to any speed step except 0, Air Brakes are not enabled; instead the F7 key will now manually activate Squealing Brake/Flange sounds but will not affect the locomotive’s deceleration.

  **Note:** If the direction state is changed while moving, F7 is enabled to act as a brake without the need to reduce the throttle to speed step 0. After stopping and changing direction, the loco will accelerate back to its original speed.

---

24 CV 4 and CV 24 determine the deceleration rate. Applying the brakes increases the deceleration rate temporarily.

25 If the optional Cylinder Cocks feature is not included in your model, the F7 key will produce a long Air Let-off.
Three Stages of Shut Down: 1. Disconnect, 2. Standby, 3. Total Shut Down (F9)

Steam Locomotive Shut Down has three distinct stages that you can control. Each stage is entered by double-pressing the F9 key.

Stage One: Disconnect

- Double-press the F9 key in Neutral to enter Disconnect. The motor drive will be disabled. Once you hear the Long Air Let-off after entering Disconnect, which represents the locomotive’s reverse lever being placed in the neutral position, the throttle can be moved up and down without the steam locomotive moving. Instead, you will hear the sound of steam gradually being vented through the throttle. All Function Keys are active in Disconnect.

- To leave Disconnect, either double-press the F6 Start Up key, as described in the Start Up section on page 26 or double-press the F9 key again to reach Standby, the next stage of Shut Down.

Note: With steam locomotives, there is no affect on the throttle Sound-of-Power if the Dynamic Brakes are on in Disconnect, as there is with diesels.

Stage Two: Standby

- Double-press the F9 key while in Disconnect to enter Standby. You will hear a Long Air Let-off followed by a special “Idle” state where Directional Lighting and the optional Mars Light will shut down.

- To leave Standby, either double-press the F6 Start Up Key, as described in the Start Up section, or double-press the F9 key again to reach the final stage of Shut Down: Total Shut Down.

Note: The motor will remain disconnected, while the Blowers shut down. Automatic Number Board Lights and Cab Lights will continue to operate. In Standby, the locomotive will not respond to throttle or function keys.

Note: Standby is ideal for leaving your locomotive in an idle state on a siding. Besides hearing occasional Air Pump sounds, the locomotive will not respond to accidentally changing the throttle setting or pressing the function keys.

Stage Three: Total Shut Down

Total Shut Down allows the operator to take the locomotive “off line” (turn off sounds, lights, ignore throttle settings and function commands) independent of the operating session. The locomotive will still be “off line” when power is reapplied for the next operating session, regardless of whether the next session is Analog (conventional DC) or DCC.

- Double-press the F9 key in Standby to enter Total Shut Down. You will hear a Long Air Let-off. The Air Pumps will turn off, followed later by the sounds of Pop-Off operating for about ten seconds, which in turn is followed by a hiss that gradually trails off to silence. The Number Boards (if so equipped) will turn off, and finally the Cab Lights (if so equipped) will turn off.

- To leave Total Shut Down, double-press the F6 key.

Note: In Total Shut Down, the locomotive will not respond to throttle or function keys. The two exceptions are the F6 Start Up Key (described below) and the F10 Status Key (also described below).

Note: If power is turned off at any stage of Shut Down (Disconnect, Standby or Total Shut Down) or during a Shut Down procedure, the locomotive will remember the last Shut Down stage in which it was during power down, and the locomotive will power up in the same stage. If Start Up is initiated during any of the above Shut Down procedures, Shut Down is aborted, and locomotive will return to normal operation.

Dynamic Brakes (F5)

Prototype steam locomotives do not have dynamic brakes. However, the Dynamic Brake function has been included to make a Quantum steam locomotive behave in a similar fashion to the rest of the consist when it is consisted with other types (e.g., diesel) of Quantum-equipped locomotives.

- Pressing the F5 key in Forward or Reverse will reduce steam exhaust Sound-of-Power to the lowest setting allowing the steam labored sounds to be consistent with other locomotives that do have Dynamic Brake sounds in multiple unit consists.

- Pressing the F5 key in Neutral will have no Dynamic Brake effect.

Note: Dynamic Brakes automatically turn off when entering or leaving Neutral, when locomotive speed drops below 7 smph (11 skph), or when the throttle is turned up. Dynamic Brakes cannot be turned on in Forward or Reverse unless the locomotive speed is over 8 smph (13 skph).

Note: In contrast to Air Brakes (F7), Dynamic Brakes do not increase the deceleration rate specified by CV 4 and CV 24.

26 Double-pressing is defined as two F9 commands sent within two seconds. Note that the F9 key may have to be pressed three times, due to the DCC command station and locomotive having different initial states for F9. Double-pressing ensures that Shut Down stages are not entered or exited accidentally.

27 Pressing a function key will produce only a Short Air Let-off.

28 It would be inconsistent for a steam locomotive to be working at full Sound-of-Power while Dynamic Brakes are being applied to other locomotives within the same consist.

29 Dynamic Brakes on prototype locomotives are less effective and are seldom used at low speeds.
**Start Up (F6)**

If your Quantum equipped steam locomotive is in any stage of Shut Down, you can return it to normal operation by double-pressing\(^{30}\) the F6 key. Start Up will be different for each stage of Shut Down, but all will start up with a Long Air Let-off and will enter normal operation.

**Start Up from Disconnect:** If you double-press the F6 key in Disconnect, the steam locomotive will produce a Long Air Let-off, and the locomotive will enter normal operation.

**Start Up from Standby:** If you double-press the F6 key in Standby, the steam locomotive will produce a Long Air Let-off, Directional Lighting will turn on, and the locomotive will enter normal operation.

**Start Up from Total Shut Down:** If you double-press the F6 key in Total Shut Down, the steam locomotive will produce a Long Air Let-off, the Dynamo will rev up, and the Directional Lighting will turn on. The Cab Lights will come on (if so equipped); the Number Boards will come on (if so equipped) followed by Air Pumps starting up, the steam Blower turning on, and the locomotive entering normal operation.

Note: During the Start Up procedure, none of the DCC function keys are active.

However, if the throttle is turned up from zero during any of the above Start Up procedures, the Start Up procedure will abort, and the locomotive will enter normal operation.

**Mute (F8)**

The Quantum System allows you to reduce the System Volume to a lower level or increase it back to its original setting by using the F8 function key. This capability is useful when you need to reduce the sound quickly to engage in a conversation or to answer the phone. If you have many trains operating at once, you can reduce the volume on all those that are running in the background of the layout and increase the volume of the closest locomotive. The Mute feature changes the sound gradually over a second or two, which allows the sound to increase or decrease realistically as the locomotive approaches or recedes from the observer.

- Press the F8 key in Neutral or Forward/Reverse to decrease or increase the locomotive’s volume gradually.

Note: The Mute state is not maintained if power is turned off and then turned back on; the locomotive will return to full system volume setting.

Note: Mute Volume can be programmed in CV 51.1.

\(^{30}\) Double-pressing is defined as two F6 commands sent within two seconds. Note that the F6 key may have to be pressed three times, due to the DCC command station and locomotive having different initial states for F6. Double-pressing ensures that Start Up is not entered accidentally.

---

**Heavy Load (F9)**

Heavy Load is applied while the train is moving; it maintains the train at a steady speed while allowing you to have control over the sound effects of a working locomotive. Under Heavy Load, changing the throttle will have little effect on the locomotive’s speed. Instead you can use the throttle to control a steam locomotive’s laboring Sound-of-Power sound effects. When you approach a grade under Heavy Load, increase the throttle and hear the locomotive work hard with heavy laboring sounds. When the locomotive goes down a grade, reduce the throttle to diminish the locomotive’s laboring sounds. You can control how hard the locomotive works by changing how much the throttle is increased or decreased from its initial position (where Heavy Load was turned on).

- Press F9 and hear one short hoot when Heavy Load is turned on
- Press F9 and hear two short hoots when Heavy Load is turned off.

You can apply Heavy Load as soon as you start moving or wait until you are up to speed.

Note: Return the throttle to its initial setting (where Heavy Load was turned on) to avoid acceleration or deceleration when Heavy Load is turned off.

Note: Heavy Load can only be turned on or off in Forward or Reverse. If turned on, it will remain on in Neutral. If you want it off when you start out from Neutral, immediately do so when the throttle is turned up.

Note: Heavy Load is automatically turned off when track power is turned off.

Note: Heavy Load represents a train that would take over ten minutes to accelerate to full speed or to bring to a complete stop. It is independent of any inertia (or momentum) values set in CV3, CV4, CV23, or CV24.

Note: Under RTC and Heavy Load, grades, voltage changes, tight curves or other real loading effects, will have little effect on the speed of the train. By contrast, under STC and Heavy Load, grades, loading, etc. will affect the train speed as it moves around the layout.

**Status (F10)**

The Quantum System provides verbal information about the locomotive’s current operating state when the locomotive is in Neutral or the locomotive’s current speed in scale miles per hour when the locomotive is moving.

- Press the F10 key in Neutral; the locomotive will verbally report its currently enabled long or short DCC address followed by its consist ID (if it has one), followed by its Shut Down state, if any (Disconnect, Standby or Shut Down).
• Press the F10 key when moving; the locomotive will verbally report the locomotive’s speed in scale miles per hour (smph) or in scale kilometers per hour (skph)

  **Note:** When Status Report (or Verbal Speedometer Readout) is activated, the locomotive’s sounds will reduce to one half their current volume settings during the verbal report. Locomotive sounds return to normal volume when the report has ended.

  **Note:** In a consist, all locomotives will simultaneously report their status when the F10 key is pressed unless disabled in CV 22.

  **Note:** Status in Forward and Reverse can be configured to also report the Back EMF value and/or motor Pulse Width Modulation (PWM) value. See CV 55, QSI Feature Configuration in the Quantum DCC Reference Manual, version 4.

**Function Key Operation in Neutral**

Some function keys will have different effects when used in Neutral from what they do when used in Forward and Reverse:

- The F7 key produces Squealing Brake Sounds or applies brakes for a moving locomotive but produces a Long Air Let-off in Neutral.
- Pressing F6 results in Doppler shift for a moving locomotive but activates Start Up in Neutral.
- Pressing F9 turns on/off the Heavy Load feature in a moving locomotive but, when double-pressed, activates Shut Down in Neutral.

  **Note:** The Whistle, Bell, Doppler Shift, Squealing Brake and Neutral sounds are described in detail on pages 36-38, in the Quantum System Sounds section of this manual.

**Horn (F11) (optional)**

Some prototype steam locomotives had both a steam whistle and an air horn. The whistles worked best in areas where it was necessary for the sound to carry a long way, while the horn was more useful in the city or foggy areas where it was easier to tell the location of the locomotive by its higher pitched sound.

- Press the F11 key to alternate between Horn and Whistle. Hear a short hoot of either the Horn or Whistle to indicate which one has been selected. Whichever is selected, either the Horn or Whistle, it is controlled by the horn button (F2).

  **Note:** The feedback hoots can be disabled/enabled using CV51.2.

**Smoke (F12)**

The F12 key is used to control the smoke generator in your Atlas O steam locomotive. Before attempting to operate the smoke unit, prime the smoke unit by inserting 20 drops of smoke fluid into the locomotive’s smoke stack and then turn the smoke unit on. (See the first Note below.)

- Press the F12 key once to turn on the smoke generator
- Press the F12 key again to turn off the smoke generator

  **Note:** The smoke unit switch, located under the water hatch at the rear of the tender and labeled SMK/NO SMK, must be set to the SMK position in order for F12 to operate the smoke unit.

  **Note:** If there is no smoke fluid in the smoke unit, make sure that the smoke unit switch is set to its NO SMK position. If you fail to turn the smoke unit off under these circumstances, it will overheat and be destroyed.

---

31 Scale speed report can be programmed to announce in smph or skph under DCC in CV56.0. This choice will apply to both DC Analog and DCC operation. The default is smph.
Most DCC command stations currently available will program Quantum equipped locomotives in either Service Mode on a programming track or Operations (Ops) Mode on the main track. In Service Mode, your locomotive (if queried) will report back CV values to your command station in the same way as other decoders report these values. In Ops Mode, these reports use CV 64, are verbal, and use the locomotive’s sound system.

Changing the System Volume Electronically in CV 51.0
You can change the volume either manually (as described on pages 9-40 in the Special Operation and Troubleshooting section of this document) or electronically using QSI CV 51.0 in DCC. To change volume in Service or Ops Mode, do the following:

- Set CV 49 to 0.
- Enter the System Volume in CV 51. The System Volume can be set to any value between 0 (no sound) and 127 (maximum sound). The default System Volume is 127.

**Note:** When you change the System Volume in Ops Mode, you will immediately notice the change in volume.

**Note:** System Volume changes made in DCC also apply to Analog and vice-versa.

Changing the Mute Volume Electronically in CV 51.1
To change the Mute Volume in Service or Ops Mode, do the following:

- Set CV 49 to 1.
- Enter the Mute Volume in CV 51. The Mute Volume can be set to any value between 0 (no sound) and 63 (50%). The default Mute Volume is 0.

**Note:** When you change the Mute Volume in Ops Mode and the locomotive is muted, you will immediately notice the change in volume.

**Note:** The effective Mute Volume level will be the smaller of the Mute Volume setting or one-half the current System Volume. In other words, the effective Mute Volume will never be more than one half of the maximum System Volume.

Enable/Disable Whistle Triggered Doppler Shift (CV 51.2)
- Set CV 49 to 2.
- Set CV 51, bit 0, to 0 to disable Whistle Triggered Doppler, or set the bit to 1 to enable Whistle Triggered Doppler

Changing Individual Sound Volumes (CV 52.X 34)
To change the volume of individual sounds listed in the table below do the following:

- Set CV 49 to the Primary Index for the individual sound from the table below.
- Enter the desired Volume level in CV 5 as follows: “0” = No sound, “1 – 15” sets volume from the lowest level at “1” to the highest at “15”, with volume levels at 2 dB increments. Defaults are typically 11.

<table>

</tbody>
</table>

See your Steam Locomotive Information Sheet for the default settings of Individual Sound Volumes.

34 ‘X’ refers to the value in column 1 of the table, the Primary Index number that will be entered into CV 49.
35 Setting any Individual Sound Volume in DCC will also apply to Analog and vice-versa.
36 The Volume setting for Chuff 1 and Chuff 2 will also apply to Analog. However, since there is only one setting for Chuff Volume in Analog, POP 26 will change the volume level of Chuff 1, which will also apply to Chuff 2. Please see pages 14-15 in this manual for an explanation of how POP values are changed. When returning to DCC, both Chuff Volumes will be at the same value as set in Analog.
37 The Volume setting for Pump 1 and Pump 2 will also apply to Analog. However, since there is only one setting for Pump Volume in Analog, POP 26 will change the volume level of Pump 1, which will also apply to Pump 2. When returning to DCC, both Pump Volumes will be at the same values as set in Analog.

32 If your DCC command station will not program your locomotive in Service Mode, you can program all CVs in Operations Mode and read their values using CV64. Alternatively, check with the manufacturer of your command station; some companies will give you a free Service Mode Programming upgrade. Also, see the Special Operation and Troubleshooting section starting on page 39.

33 In Ops Mode, you will hear the value spoken out when changing the value of a CV unless the verbal readout feature has been disabled by setting CV 62 = 0.
Bell Type Selection (CV 55.3.1)

The Quantum System installed in your locomotive may have more than one type of Bell sound. To select different Bell sounds,

- Set CV 49 to 3.
- Set CV 50 to 1
- Set CV 55 to a number from 0 to n to select Bell type. The default is 1; Feedback Bell selection is 0 (used for locos where the prototypes did not have bells).

Note: To determine the number of Bell types, n, set CV 49 to , set CV 50 to 0, and set CV 64 to 55 to hear a verbal response in Ops Mode.

Note: If you set “n” at a higher value than the number of available Bells, Quantum will select the “Feedback Bell”, type “0”.

Standard Throttle Control and Regulated Throttle Control Options (CV 56.4)

- Set CV 49 to 4.
- Set CV 56 to 0 for Standard Throttle Control or to 1 for Regulated Throttle Control. The default is 1, Regulated Throttle Control.

Note: CV 2, CV 3, CV 4, CV 5 and speed tables apply to both Standard and Regulated Throttle Control.

Reset all CV’s to Factory Default Values (CV 56.128.255)

To reset all DCC parameters, enter the following three CV values.

- Set CV 49 to 128.
- Set CV 50 to 255.
- Set CV 56 to 113

Note: The above DCC reset procedure does not affect Analog settings, except for volumes.

Note: In Ops mode, you will hear “Reset” when the reset is completed.

Special Procedure for Operations Mode Programming of Short or Extended Addresses

If you wish to use Operations Mode (Ops Mode) programming (i.e. programming on the main line) to program an Extended ID (4-digit address) when your locomotive is currently using a Short (2-digit) address or vice versa, the following special procedure must be followed with most Command Stations.

If, however, your Command Station does not allow you to program locomotive addresses (CV 1 or CV 17 and CV 18) in Ops Mode, instead use one of the two Alternate Procedures that are described in the following sections.

- Operate the locomotive on the main line using its current DCC address.
- Disable verbal announcements by using Operations Mode programming to set CV 62 to 0. Since you have just disabled verbal announcements, you will not hear any verbal confirmation of the value of 0 that you wrote into CV 62. This step is essential.
- Follow the procedure in your DCC system manual for programming a new address using Operations Mode programming on the main line. If you are programming a long address, make sure that you activate this long address. In particular, if you have a Digitrax DCC system, be certain to press the “Y+” key IMMEDIATELY after you see “Ad4on?=y” displayed on the DT400 throttle screen.
- Change your DCC system from its configuration for Operations Mode programming to the configuration for running a locomotive on the main line (if your DCC system doesn’t perform this reconfiguration automatically).

41 Vice versa means programming a Short (2 digit) address when your locomotive is currently using an Extended ID (4-digit address).
42 This special procedure is necessary because (when programming a 4-digit address into a locomotive that is operating on a 2-digit address) DCC systems will send commands to the locomotive to change the values of three different CVs (CV17, CV18, and CV29). Any verbal CV value announcement will interfere with the reception of the new value for CV29 and possibly also CV18.

38 Feedback Bells produce a single light “ding” when turning the bell on and a double “ding” when shutting the bell off. This bell type is suitable for locos that are not intended to have bells but need a bell sound to indicate that the bell state is on or off. Please note that Atlas O steam locomotives do not use feedback bells.
39 Consult the NMRA DCC Reference Manual for Quantum Q1a and Q2 Equipped Locomotives (Version 4.2.0) to learn how to reset different groups of CV’s.
40 “113” is QSI’s Manufacturer’s ID Number assigned by the NMRA.
Verify that the locomotive can operate on the main line using its new address.

If the locomotive responds properly to the new address, re-enable verbal announcements by using Operations Mode programming to set CV 62 to 1. In this case, you will hear verbal confirmation of the CV 62 value of “1” that you just entered since you have re-enabled verbal announcements.

Alternate Procedures for Short or Extended Address Programming with Certain Command Stations (CV 56.129)

If you cannot program your Short or Extended ID number in Service Mode and your DCC command station prevents you from setting these addresses in Ops Mode, use one of the following two alternate procedures to program your locomotive’s addresses instead of the procedure described in the last section.

Alternate Procedure for Entering Short (Primary) Address in CV 56.129.1 in Ops Mode

- Set CV 49 to 129.
- Set CV 50 to 1.
- Set CV 56 to your Short Address (1 or 2 digits). Hear the address spoken back (“CV 1 = X”).
- If necessary, set CV 29, bit 5 to ‘0’ (or set CV 29 to 6, which is the factory default) to enable your new Primary Address.

Alternate Procedure for Entering Long (Extended) Address in CV 56.129.17 in Ops Mode

- Determine the values of CV 17 and CV 18 for your Extended Address from the ID Table in your Locomotive Information Sheet. If you want to calculate a different ID number, follow the instructions in the NMRA DCC Reference Manual for Quantum Q1a and Q2 Equipped Locomotives, Ver. 4.2.0, for an explanation of how to calculate the values of CV 17 and CV 18.
- Set CV 49 to 129.
- Set CV 50 to 17.
- Set CV 56 to the desired value of CV 17 (from the ID table or your calculation). Hear the value of CV 17 spoken out (“CV 56.129.17 = X”).
- Set CV 50 to 18.

Set CV 56 to the value of CV 18 (from the ID table or your calculation). Hear the value of CV 18 spoken out (“CV 56.129.18 = Y”).

If necessary, set CV 29, bit 5 to ‘1’ (or set CV 29 to 38) to allow operation with your new Extended Address.

Disable/Enable Verbal Announcements (CV 62)

In Ops Mode, the Quantum System will automatically speak out the value of each CV that you enter.

- To disable, set CV 62 to 0 (no verbal response); to enable, set CV 62 to 1 (hear “CV 62 equals 1”). Default is “Enabled”.

CV Inquiry with Verbal Feedback in Ops Mode (CV 64)

To inquire about the current value of any CV through Verbal Feedback in Ops Mode:

- Set CV 64 to the CV you wish to query. Hear the verbal message “CV ‘X’ equals ‘Y’”, where ‘X’ is the CV number and ‘Y’ is the value.
  
  **Note:** If the CV has a Primary Index such as QSI CV nn.pp (where nn is the CV number and pp is the Primary Index), set CV 49 to pp before you set CV 64 to nn. For example, if you want to inquire about the Diesel Motor Volume, which is CV 52.10, set CV 49 to 10 and set CV 64 to 52. You will hear, “CV five two point one zero equals ‘Y’ (where ‘Y’ is the current volume setting). If the CV has both a Primary and Secondary Index, such as CV nn.pp.ss where ss is the Secondary Index, set CV 50 to ss in addition to setting CV 49 to pp before you set CV 64 to nn.

  **Note:** If you enter either ‘17’ or ‘18’ in CV 64, you will hear the full one to four digit Extended Address ID number spoken out.

  **Note:** Disabling Verbal Announcements (CV 62) will not disable CV Inquiry (CV 64).

For more information on DCC Programming, download from the QSIndustries web site [http://www.qsindustries.com](http://www.qsindustries.com) the NMRA DCC Reference Manual for QSI Quantum Q1a and Q2 Equipped Locomotives, Ver. 4.2.0. This Reference Manual applies to both HO (Q1a) and O scale (Q2) locomotives that use Quantum System Version 7 software.

---

43 If you want to verify your extended address, set CV 64 to 17 (or 18) to hear the full address spoken out.

44 Entering “38” leaves the other configuration settings in CV 29 at factory default, but changes the ID to Extended Address type.

45 This option is not affected by CV 62 (Disable/Enable Verbal Announcements).
Steam Chuff: The familiar steam chuff comes from steam exhausted from the steam chest through the smoke stack and creates a powerful draft to feed the fire. QSI Quantum Chuffing produces four distinct Chuff sounds per drive wheel set, a rhythm recognized by all steam fans.

Articulated Chuff: Articulated or Duplex steam locomotives have two sets of steam Chuff sounds that will go gradually in and out of synchrony. Most articulated locomotives had less weight over the front engine, which resulted in more slippage, causing the two engines to run at slightly different speeds.

Cylinder Cocks: When a steam locomotive sits idle for an extended period of time, water condenses and collects in the steam chest. Since water is not compressible and can damage the cylinder valves, the engineer must open special cocks on the steam cylinders to allow the water to be ejected as the piston moves. As the locomotive moves out, clouds of steam and water are propelled out on either side of the locomotive in such a flurry that it sometimes obscures the wheels and valve gear of the engine. Hear the sounds of Cylinder Cocks on the model as the locomotive starts out after it has been idle in Neutral for at least 25 seconds. The Cylinder Cock sounds are synchronized to the Chuff and shorten in duration as the loco’s speed is increased. After the locomotive has reached 12 smph or 16 Cylinder Cock sounds have occurred, the Cylinder Cock sounds will slowly terminate as the last of the water is expelled and the engineer shuts off the cylinder cocks valves.

Whistle: The Quantum System uses authentic locomotive sounds whenever possible. If you blow the Whistle briefly, you will produce a realistic short Whistle sound or “hoot”. Some locomotive models have special Whistle Endings, which can be “played” by tapping the whistle/horn button on your DCC system immediately after finishing the Whistle operation.

Horn (optional): Some steam locomotives had both a whistle and a horn. If a Horn is included on your model, it can be selected with the Alternate Horn Selection key, F11. The Quantum System uses authentic locomotive sounds, whenever possible. If you blow the Horn briefly, you will produce a realistic short Horn sound or “hoot”. Some Quantum Sound sets have a special Horn Ending, which can be “played” by tapping the horn button immediately after finishing horn operation. DCC only.

Bell: Steam locomotives can have either a pull bell or a pneumatically-operated mechanical bell. With pull bells, you will hear a different sound as the bell swings forward and backward producing the familiar ding-dong effect. Pneumatic bells produce a very repetitive ring and often at a much faster ring rate than a pull bell. During turn-on in Neutral, you will hear the pneumatic clapper gain greater throw with each stroke until it finally strikes the Bell. During shut down in Neutral, you will hear the Bell sound fade out for either pneumatic or pull Bells.

Doppler Run-by: The sounds of the locomotives get louder as the train approaches, and then immediately drop to a much lower pitch and lower volume as the train passes by. With a little practice, you can activate the Doppler Effect exactly when and where you want. Doppler pitch change is based on the speed of the locomotive, so the sounds change more dramatically when the locomotive is running faster. After the Doppler shift has occurred and the Whistle is no longer being blown, the Bell shuts off automatically, and locomotive sounds return to normal.

Air Brakes: When prototype train brakes are applied, air is released from the brake lines to reduce the pressure. The more the pressure is reduced, the greater the braking. You will hear a continual air release sound from the steam locomotive model as braking is continually increased. The longer the air is released, the more quickly your Atlas O steam locomotive will slow down. Once all the pressure is released, the locomotive will continue at maximum braking, which can still require a long stopping distance depending on your Load settings.

Controllable only with DCC or QARC.

Blower or Steam Locomotive Hiss: On a moving locomotive, the steam from the steam chest venting through the smoke-stack draws air through the fire box, keeping the fire healthy. When the locomotive is sitting still, blowers are often turned on to vent steam through the smoke stack to maintain the draft. Blowers were often turned on and off the locomotive started out. The QSI steam Blower sound on steam locomotives will turn on gradually followed by a continual steam hiss. The turning on and off of steam Blower Sounds is automatic and depends on the direction state.

Air Pumps: When a locomotive is sitting still, the pumps come on at a steady beat to replace the air lost from the brake air release and from pneumatically operated appliances. Once the pressure is up, the pumps only operate occasionally to maintain the pressure. Large steam locomotives may have more than one pump operating independently.

Appliance Air Release: Compressed air is used on locomotives for operating various appliances. You will hear either a Short Air Let-off or Long Air Let-off at various times.

Brake Squeal: You can hear the brakes squeal on prototype locomotives when they are moving slowly. This sound can become quite loud when the wheels are just about to stop turning. Listen for automatic Squealing Brake sounds at slow speeds and the final distinctive squealing sounds as the Quantum equipped steam locomotive slows to a stop.

Coupler: To give you the most authentic coupler sounds, QSI has identified three distinct types of coupler activity. The first is when the coupler is Armed, where you hear the clanking sound of the coupler lift bar and coupler pin raising. The next is Firing the coupler, where you hear

---

46 Not all features described here are included on every Atlas O steam locomotive. Consult the Steam Locomotive Information Sheet that is included with your model for a list of features and sounds that apply to your particular locomotive.
the opening of the coupler and the hiss of the air-lines parting. The third sound occurs when
the locomotive couples up to its load of cars, and you hear the Coupler Crash as all of the cars
bunch together from the impact. Controllable only with DCC or QARC.

Flanges: When a train enters a curve, the flanges on the wheels ride up on the inside of the
rail and usually squeal. Recreate this squealing effect by pressing and releasing the Squealing
Brake/Flanges DCC F7 function key or QARC Analog button quickly and repeatedly as neces-
sary. Controllable only with DCC or QARC.

Steam Pop-off: If there is too much steam pressure in the boiler, special pop-off valves, or
safeties, on top of the locomotive release the excess pressure in a fury of hissing steam that
often will blow for 30' or more above the locomotive. This happens most often when the loco-
motive is sitting still, since the fire continues to build up steam that is not used. The Quantum
Pop Off sound comes on for random lengths at random times in Neutral.

Steam Water Injector: The water used to make steam is replaced by water injectors at high
pressure, to overcome the elevated pressure in the boiler. The sound of rushing water and
steam hiss ends with a distinctive valve shut off. This sound comes on for random lengths of
time and occurs randomly when the locomotive is in Neutral.

Steam Boiler Blow Down: As water evaporates, minerals and other residues settle to the
bottom of the boiler. The fireman opens a valve to vent this material through a large pipe
under the side of the cab onto the ground. Quantum’s Blow Down sound occurs at random in
Neutral for varying lengths of time.

Locomotive Shut Down (Extended): A Long Air Let-off will first occur followed by the
steam Dynamo revving down and the Directional lights shutting off. The Air Pumps will turn
off, followed by the sounds of the Pop Off valve operating for about ten seconds, and finally
the Blower Hiss will shut off. Controllable only with DCC or QARC.

Locomotive Start Up (Extended): The Dynamo will rev up while the Headlight comes
on gradually. Then the Cab Lights (if available) will turn on, followed by the Air Pumps. The
steam Blower will turn on, and then the locomotive will enter normal operation. Controllable
only with DCC or QARC.

For a more detailed description of this material, see the Troubleshooting section in either the
NMRA DCC Reference Manual for Quantum Q1a and Q2 Equipped Locomotives, Ver. 4.2.0, or
the DC Analog Reference Manual for Quantum HO Equipped Locomotives, Ver 4.0. Both docu-
ments are available online at http://qsindustries.com

DCC Program Track Operation

This locomotive conforms to NMRA standards for program track operation. However, the
Quantum System requires more current to operate than do standard DCC decoders and may
not respond to the limited program track power available from some DCC command stations.
If you are unable to program in Service Mode on your program track, all CV’s in your Gold
Series locomotive can be programmed in Ops Mode. (Atlas O recommends using Ops Mode
programming on its Gold Series locomotives, whenever possible.) You can also purchase from
Tony’s Train Exchange®47 or other DCC dealers who handle DCC Specialties®48 products, a simple,
inexpensive program track power booster (PowerPax™) that will allow you to program on the
program track with any DCC command station.

Manual Controls

Quantum equipped locomotives include special manual controls to adjust the sound volume or
reset the locomotive to factory default values. To initiate these operations, Atlas O Gold Series
steam locomotives use a special reed switch located under the rear portion of the top of the
tender, at the position identified in the Steam Locomotive Information Sheet that is included
with your model. This reed switch can be activated by the Magnetic Wand shipped with your
locomotive, with no need to disassemble the locomotive.

To Adjust the Overall Volume Using the Magnetic Reed Switch
(Analog and DCC)

• Locate the reed switch area on the top of the tender as shown in the Steam Locomotive
  Information Sheet that is included with your model.
• Power up the locomotive and leave in Neutral.
• Place the metal part of the enclosed Magnetic Wand over the reed switch area on the top

48 DCC Specialties; 800-671-0641; http://www.dccspecialties.com
of the tender and perpendicular to the rails of the track. Wait as you hear the volume increase or decrease in incremental amounts as the Whistle hoots about every second. Move the wand upwards (away from the tender) and then place it over the reed switch area again to reverse the direction (louder or softer) of the volume change. Remove the wand when you reach the desired volume level.

Note: System Volume may also be adjusted digitally using the programming methods described in the Analog and DCC programming sections in this manual.

To Reset Your Locomotive Using the Magnetic Reed Switch (Analog and DCC)

If the Quantum System sound and control system installed in your Atlas O Gold Series steam locomotive is not operating properly and if turning off the power for 15 seconds does not return it to normal operation, you should reset all DCC and Analog parameters in the locomotive to their original factory-default values. To perform this reset, use the Magnetic Wand that was packed with your locomotive, and proceed as directed below. Please note that whenever you have a problem that you cannot resolve otherwise, you should reset your Gold Series locomotive using the magnetic wand on a DC-powered track even if this locomotive is to be operated only on DCC. A reset done with the magnetic wand is more complete than the DCC-only reset done using CV 49, CV 50, and CV 56.

Procedure for Resetting using the Magnetic Wand

1. Turn off all track power to your layout
2. Place your Atlas O Gold Series sound-equipped steam locomotive on the track
3. Identify the reed switch area on the top of the tender. The arrow in the photo of your Atlas O Gold Series locomotive that appears on page three of the locomotive information sheet (packed with your locomotive) points to the part of the tender under which the reed switch is located.
4. Place the Magnetic Wand over the reed switch area in the tender with the metal tip (the shiny silver part) of the wand at a right angle to the rails of the track and on or just above the top of the tender. (Keeping the wand in the small plastic bag in which it was shipped prevents possible marring or scratching of the top of the tender.)
5. Gradually apply conventional DC power to your track until the track voltage increases from 0 to approximately 10 to 11 volts. Then stop increasing the voltage.

6. Continue to hold the magnetic wand just above the tender roof until you hear the word “reset” spoken from the locomotive.
7. Pull the Magnetic Wand straight up away from the tender immediately after you hear “reset” so that the Quantum manual volume adjustment procedure is not activated.
8. The sound decoder in your Atlas O Gold Series sound-equipped steam locomotive has now been returned to its original factory-default (Analog and DCC) parameter value settings. Please note that it is essential to use conventional DC track power for this reset to work properly.

Recommended O Scale Track Voltages (Analog and DCC)

Your Atlas O Gold Series steam locomotive is designed to operate on the normal track voltage supplied by most O scale power packs. However, Atlas recommends that your track voltage not exceed 16 volts DC if you are using conventional DC power or 16 volts AC if you are using DCC. For best performance with DC operation, it is recommended that you also set Vmax = 16 volts. (See page 17.)

Reasons Why Your Locomotive is Silent or Will Not Start (Analog and DCC)

In case your locomotive remains silent after power up and turning the power off and back on does not return it to normal operation, try the following suggestions to bring your locomotive back to normal sound operation.

- Make sure the locomotive has not been Muted with the DCC F8 key or the Quantum Engineer Mute Key.
- Check to see if your Manual Volume Control or Programmed Digital Volume has been turned all the way down.
- You may have shut down your locomotive in DCC using the F9 key, or in Analog using the Quantum Engineer Shut Down key. Use the F6 key in DCC or the Quantum Engineer Start Up key in Analog or use the Magnetic Wand in Analog, which both selects and starts the locomotive.
- If the above methods do not start your locomotive, use the magnetic wand to reset your locomotive to factory default values, as described above.

Note: The Magnetic Wand will not start your locomotive in DCC if it is in a Shut Down state. To start in DCC, you must first select the locomotive with its ID number and then use the F6 key. It will take a couple of seconds after you double-press the F6 key before you will hear the pump sounds start.
**Note:** It does not make any difference whether you start your locomotive in DCC or DC. Once started, you can return to either DC or DCC operation.

### Upgrading to New Sounds and Features

The Q2 Upgrade Chip contains software that will allow it to reprogram itself using a PC and the QSI Programmer module, which in turn is wired to a program track. Using this method, the Q2 chip can be upgraded to new software, enhanced with new features, or modified to use new or different sounds. New software and sound sets will be available through the QSI web site at [http://www.qsindustries.com](http://www.qsindustries.com).

To perform the download, refer to the operating instructions and documentation supplied with the Quantum Programmer.

* Quantum Analog Remote Control (QARC) Technology allows commands to be sent to locomotives under Analog control to operate different Quantum features. With QARC technology, you can operate features that are otherwise available only in DCC plus certain features that are not yet available in DCC. QARC controllers are useful accessories that employ the QARC system.
QSIndustries, Inc. Software License Agreement

1. Grant of License: QSIndustries, Inc. grants you, the owner, and the right to use the software that is included with your Quantum System only with the locomotive that you purchased.

2. Copyright: The software is owned by QSIndustries, Inc. and is protected by United States copyright laws and international treaty provisions. Therefore, neither you nor anyone else may copy the software.
